Surgical Report: One Dark Stranger (With Grace_Always B Miki)

Lot: 207

Procedure: Left hock arthroscopy

Agent: Dancingtonmoonlight Ltd

On December 16th 2025 'One Dark Stranger' was presented to the Rangiora Veterinary Centre Equine Hospital for left hock arthroscopy. Radiographs confirmed OCD fragments of the left distal intermediate ridge of the tibia.

The left tarsocrural joint was entered and explored arthroscopically. An OCD lesion of the distal intermediate ridge of the tibia was evident comprising three fragments loosely attached to the fragment bed. The fragments were elevated and removed. The fragment bed was debrided down to normal subchondral bone. The joint was lavaged thoroughly prior to routine closure of the incisions.

There were no additional cartilage damage or wear lines in the left tarsocrural joint.

The surgical site had a sterile bandage applied. Recovery from anaesthesia was uneventful.

The colt has a good prognosis for racing.

If you have any further questions, please feel free to contact the clinic.
